Modularity is a popular design trend in software development as better ways to reuse code and design patterns are developed. In particular, software applications are being designed and developed to provide a variety of functions from a variety of vendors. These applications are often written using web-based technologies and client side technologies that run on devices such as mobile phones and personal computers. Because these applications run in various environments, it can be difficult to reuse the code for a wide variety of devices and environments. The web has also ushered in the development of web applications that typically employ large monolithic web applications. The large monolithic web applications are typically built for the web from scratch. These monolithic web applications are often designed and developed with a given end user in mind. Unfortunately, this often results in the monolithic web application being lacking in some areas or lacking the flexibility to meet the needs of various end users. There are many different types of electrical equipment presently in use. In certain types of electrical equipment, it is desirable to have the ability to generate a self-test signal in
