Their activity is not open to the public, so we cannot be 100% sure that the leak didn't come from some other source. The latter also has the risk that the files posted really are exactly the ones leaked, but it's unlikely. In that case the linked files might be patched. A: Someone from the MIT CSAIL campus has this account. The oldest available photo is from October 7, 2015, and the latest one is from June 1, 2019. This may well be the same account as this one. Diego Costa will miss Chelsea's Premier League clash with Arsenal at Stamford Bridge. Diego Costa will miss Chelsea's Premier League clash with Arsenal on Saturday after suffering a slight tear in the muscle in his left thigh. The Spain forward missed Saturday's 3-0 victory at Southampton and the Blues revealed following the game that it was not serious. And Chelsea have now confirmed that the 29-year-old Costa, who signed a five-year contract with the club in June 2017, will now also be absent for Saturday's clash with their London rivals. Costa is set to play for Spain in the Nations League final against the Netherlands on Saturday, according to The Sun. The striker has 13 goals and six assists in 19 appearances this season, having arrived at Stamford Bridge in an £32million deal from Atletico Madrid last summer. Chelsea boss Antonio Conte confirmed after the weekend win over Southampton that Costa was not risking his fitness with the rest of the squad, rather he wanted to give the Spain international some time off. "He is not in the squad because he needs some time, maybe three, four days, to recover with the rest of the players," said Conte. "We need everyone to give us 100 percent for the next game." Costa's last appearance came in a 3-2 loss to Burnley on November 8, and he has not scored since then.

Q: jQuery - Adding data to a serialized form I have a form that I've set up to be serialized on the client-side, and I'm trying to add some custom data to the form, but it's not working. `$('#form').submit(function () { var data = $(this).serialize(); data.data = { 'custom':'something' e79caf774b`

I have no idea how to connect those lists and use them to search a huge list (file list) for specific files (k 2.02.03). I'm not a pro in this area and was wondering if anyone could point me in the right direction. Thanks in advance. A: This code will print all the file names from list1 and list2 and print them to the console as well as write them to the output path specified in the list3 parameter: 

```
import sys
import os
list1 = ['/windows/syswow64/windows/USERDL.DLL',
'C:\Users\Public\Documents\Scripts\boot-repair-script.sh']
list2 = ['boot-repair-cd.exe', 'autorun.inf', 'README.txt']
def files(paths):
    """print the list of files at a path."""
    print '[+]', 'Found files in', path
    for path in paths:
        for path_files in os.listdir(path):
            if os.path.isfile(path + '/' + path_files):
                print path + '/' + path_files
    output_dir = 'output'
    f = open(output_dir + '/file_names.txt')
    list3 = []
    files(list1)
    files(list2)
    f.close()
Now with this we can use the output file file_names.txt to search any directory path at will.
import glob
import os
import re
def get_files(filename_path):
    for path in os.listdir(filename_path):
        for path_files in os.listdir(filename_path + '/' + path):
            if re.search(r'\.[0-9]+\.[0-9]+$', path_files):
                return path_files
    f = open(output_dir + '/file_names.txt', 'w')
    for
```
