ClipArt A range of clipart may be installed. Those supplied with AutoCAD are available with different editing options, size and colour. Third-party versions can also be installed. 3D AutoCAD has many tools and functions for creating 3D models in 2D and 3D space. 3D modeling tools

Axes Axes are a tool in AutoCAD used to create 3D plots. AutoCAD comes with eight non-linear and linear axes and three rotational axes. Each axis can be rotated at any angle around its central axis, and can be moved up, down, forward or backwards. They can be used for displaying data in a plot, and creating a 3D projection, that can then be viewed from any angle. Axes are used to create a 3D plot. The dataset or object with which the axes are created is known as the control-frame, and the object can be moved around in the 3D space using the control-frame. The control-frame is often a wireframe, and axes can be rotated and stretched to create a 3D effect. Axes are used to create a 3D projection that can then be viewed from any angle. They are often used to create a plan view, an elevation view or section view. There is one additional control-frame that can be used for creating a perspective view from a 3D model. Axes can be hidden and re-appeared in the model. A coordinate plane is used to create a 2D projection, or 3D space. The coordinate plane can be seen as a 2D line in 3D space. It can be set at any point in 3D space, or aligned with the central axis of a 3D axis. A coordinate plane is used to create a 3D projection of the model, from any angle.

Arch/Boxes Archs and boxes are used to create simple 3D structures. Archs are one-dimensional geometric shapes that can be used to create objects, like a box, that can be viewed from any angle. Boxes are 3D objects that can be aligned to the central axis of an axis.

Butt Butt joints are used to create a connection between two 3D surfaces that are fixed to each other, using a pivot. Butt joints are often used to create a stronger bond between two solid bodies.
